FROM Craig Zeller, P E
Remedial Project Manager

Please find enclosed for your review and information, one (1) bound copy of the report titled, "Telephone Interviews of Residents in the Lake Hartwell Area". As you recall from our previous discussions, the enclosed report was conducted as a component of EPA's Public Education Program for the remedy that was selected to address the PCB impacts associated with the Sangamo Operable Unit Two (OU2) NPL Site. The telephone survey was conducted to determine the level of public awareness of existing fish advisories on Lake Hartwell, and how these advisories are affecting fish consumption habits of nearby residents.

At this point, I believe a project meeting between all parties interested in the future direction of the Public Education Program is warranted. Several issues that deserve discussion and resolution include: 1) Results of enclosed report and identification of additional public education activities; 2) Issuance of new fish advisory signs, sign language, and various logistical issues associated with sign installation, and 3) Schedule and scope of SC DNR creel survey (if still proposed).

If you are interested in participating in such a meeting, or know of someone else who would be, please notify me via email (ZellerCraig@epamail.epa.gov) or at (404) 562-8827. At the present time, I am targeting the weeks of August 21-25, 2000 or August 28-September 1, 2000. Proposed meeting location would be the U.S. Army Corps of Engineers Hartwell Project Office located at the Hartwell Lake dam. Thank you in advance for your participation in this effort.

Executive Summary and Report

Executive Summary

Overview

This telephone survey was conducted to provide a sense of the level of public awareness of fish advisories in Lake Hartwell and its tributaries, and how these advisories are affecting fish consumption of nearby residents. The telephone survey targeted nearby residents who might fish in Lake Hartwell, rather than known users of the Lake. Specifically, 100 residents from each of six counties (Anderson, Pickens and Oconee in South Carolina; Hart, Franklin and Stephens in Georgia) for a total of 600 respondents were interviewed from March 10-12, 2000.

The following general conclusions can be drawn:

- Most respondents are aware of the fish advisories through a variety of sources.
- Respondents who indicated that they possessed a fishing license (39%) were more likely to be familiar with fish advisories, to have obtained a copy of the brochure that was distributed to area locations frequented by users of the Lake, and to report being influenced by its contents.
- Relatively few respondents (11%) consume Lake Hartwell fish; of those 11%, half eat Lake fish less than once a month.
- Of those respondents who consume Lake Hartwell fish, 46% follow the fish advisories.
- The majority of respondents who received a brochure read all or most of it.
- An overwhelming majority of respondents who read the brochure said it helped them make an informed decision about catching and consuming fish from the Lake.

The results of the survey indicate that 73% of respondents indicated awareness that PCBs have been found in the Lake, 66% of respondents expressed awareness of the fish advisories, and 54% of respondents conveyed familiarity with the advisories. An overwhelming majority of respondents (78%) who obtained a copy of the brochure indicated that it helped them make an informed decision about catching and consuming fish from Lake Hartwell, and 52% of respondents who received the brochure indicated that it influenced their consumption of fish from Lake Hartwell. Of those respondents who received a brochure, 68% do not consume Lake fish and most of those who do eat Lake fish stated that they follow the fish advisories. The respondents who indicated that the brochure influenced their fish consumption were asked to explain how. In general, their responses reflect either an awareness of the possible effect of PCBs on health or an aversion to eating fish. Respondents who stated that the information in the brochure did not influence their fish consumption tended to express a dislike for fish. Only 4 respondents expressed skepticism of the seriousness of the fish advisories.

The widespread dissemination of fish advisory information through a variety of sources appears to have been a successful outreach strategy. Respondents indicated that they obtained fish advisory information primarily from newspapers (35%), friends (22%)

and television (19%); other reported sources of this information were Lake signs (9%), brochures (4%), and radio (3%). 8% of respondents said that they picked up or received a copy of the brochure. It is important to note that of the 50 respondents that obtained a brochure, 28 of them also had fishing licenses. 96% of the respondents that obtained a brochure and possessed a fishing license read the brochure to some extent.

Respondents who did obtain a copy of the brochure indicated that they acquired it at Lake Hartwell campgrounds or visitors' centers, via mail or through other means (e.g., U. S. Corps of Engineers, stores, and gas stations). Of those who obtained a copy of the brochure, 52% indicated that they read all or most of the brochure, about 37% stated that they read some of its contents, and 8% revealed that they did not read the brochure.

An analysis of respondents who indicated that they both had a fishing license (question 19) and ate Lake Hartwell fish (question 15) revealed that this subgroup was more likely than other residents to express familiarity with the advisories and indicate that they had obtained a copy of the brochure. Although they were not more likely to have read the brochure than respondents who obtained one but did not possess a license, they were more likely to indicate that the information in the brochure influenced their consumption of Lake fish. These respondents also appear to be quite knowledgeable about the various components of the brochure. They were more likely to express awareness that PCBs had been found in the Lake and that the northern areas of the Lake contained higher levels of PCBs than other areas. These same respondents were also more likely to report their familiarity with the fact that certain fish may have higher levels of PCBs than other fish and that deep-frying and smoking are not cooking methods that reduce exposure to PCBs. Finally, these respondents expressed awareness that trimming or cleaning away the fatty areas of fish can reduce exposure to PCBs.

Of those respondents who eat fish from Lake Hartwell, 50% eat Lake fish less than once per month, 30% eat Lake fish once a month, and 18% eat Lake fish once a week or more. Of those respondents who eat fish from Lake Hartwell, 27% indicated that they follow the fish advisories, 31% stated that they did not, and 42% provided "don't know or not applicable" responses.

Approximately 37% of all respondents (i.e., even those that indicated that they did not receive a brochure) stated that they knew that certain types of fish contain higher levels of PCBs than other types of fish and that fish caught in the northern part of the Lake may have higher levels of PCBs than fish caught elsewhere in the Lake (45%). Regarding various cooking methods, 21% expressed awareness that deep-frying and smoking were not the safest methods of cooking fish with PCBs, and 30% indicated that they knew that cleaning and removing the fatty areas of fish can reduce the amounts of PCBs in the fish.

Open-ended responses

Interviewers recorded the responses given to the five open-ended questions (numbers 2, 5, 16, 26, and 30). These responses can be found in Section 3. Some respondents had

general questions about fish advisories and PCBs, and interviewers provided standard answers given to them in advance, (i.e., what is a PCB, what is a fish advisory).

When asked what types of recreational projects they would like to see done in the Lake Hartwell area (question 30), most respondents mentioned that they would like the creation of additional parks in the area, as well as improvements made to the existing parks and marinas (e.g., upgrading facilities, more campsites, boat ramps and marina improvements).

Demographics

300 men and 300 women were surveyed. Their ages were as follows: 26% were under 35 years old, 40% were between 35 and 54, and 34% were over 55. Most respondents were white (89%) and married (66%). Their education levels varied, but most were high school graduates (31%), 33% had some college, business or technical school experience, and 22% earned an undergraduate or graduate university degree. 56% percent of respondents were employed full time; 23% were retired. The most common occupational descriptions were laborer (22%) and professional (21%); other types of jobs mentioned were technical (12%), manager/owner (11%), clerical (11%), and service (6%). When asked to indicate their annual household income range, 33% of respondents indicated an income in the \$21,000 to \$40,000 range, 22% said it was under \$20,000, and 23% said it was between \$41,000 and \$60,000. Most people described their political views as conservative (54%); 15% described their views as liberal. Finally, reported readership of the local newspaper was high (71%).

Introduction

This report is based on data collected from 600 residents of 6 counties (100 residents from each county) in the Lake Hartwell areas of South Carolina and Georgia. The survey measured public awareness of fish consumption advisories in Lake Hartwell and its tributaries, and how the advisories are affecting fish consumption. Additionally, the survey included various measures of fish preparation methods and rate of consumption. Respondents were told that the results of this survey would be provided to the U.S. Environmental Protection Agency, the South Carolina Department of Health and Environmental Control, and the Georgia Department of Natural Resources.

Methodology

Questionnaire Design:

The survey instrument was developed by researchers at DecisionQuest. Each item was carefully designed to measure a specific construct (e.g., familiarity with Lake Hartwell fish advisories). Some of the items included a forced-choice response (e.g., "Do you presently consume fish from Lake Hartwell?"), whereas other items called for an open-ended response (e.g., "What types of recreational projects (such as parks, boat ramps, fish stocking, etc) would you like to see done in the Lake Hartwell area?"). In total, the instrument contains 21 knowledge or experience questions and 9 demographic and/or personal background items.

Sampling Methodology:

The survey was conducted by telephone using a random digit dialing process whereby everyone in the target region with a telephone number had an equal chance of being selected. This standard procedure involves obtaining blocks of 100 phone numbers within the selected telephone exchanges in the region. The last 2 numbers of the sample telephone number are then generated randomly so that all phones in the exchange (both listed and unlisted) have an equal chance of being selected. A comparison of the demographic characteristics of the sample with those of the population suggests that the sample was representative of the county population.

Call Log Summary

The following table indicates the results of all telephone calls that were made to achieve 600 completed interviews. It is a common result when conducting telephone surveys to place ten times the number of telephone calls as the desired number of completed interviews, (i.e., 6792 telephone calls placed for a response rate of 600).

No answer/answering machine	3137
Repeatedly busy	105

Mid-interview quit	40
Not over 18 years old	28
Residence disqualification	124

	Total = 6792

Data management, cleaning, and analysis:

Responses to the interviews were entered into a computer data file that was subsequently verified for errors. Subsequently, the data were re-coded when necessary, and then analyzed using a standard statistical analysis software program.

Interviewing/Telephone Calls:

Telephone interviews were conducted between March 10 and March 12, 2000. The interviews were conducted on Friday from 4:00 to 9:30 p.m., on Saturday from 10:00 a.m. to 6:00 p.m., and on Sunday from 1:00 to 4:00 p.m. Interviewers were closely supervised to ensure that they followed proper interviewing procedures. The average duration of the telephone interview was 12 minutes.
